

Special Issue

Imaging of Humans: Methods and Applications

Message from the Guest Editors

Imaging of humans has always been interesting to people. Starting with cave paintings of prehistoric people and Egyptian wall paintings, people use images to explore more deeply and better understand human nature, life, and behavior. With the advent of a new era of digital technology, we are using sophisticated sensors and new image analysis techniques to extract more information from images. The idea for this special edition came about as a result of discussions at the ISPRS workshops on “Photogrammetric and computer vision techniques for video surveillance, biometrics and biomedicine—PSBB” devoted to new methods of image analysis focused on the human subject. The Special Issue “Imaging of Humans: Methods and Applications” is devoted to the problem of studying human characteristics using images as the main source of information. The main purpose of this Special Issue is to collect new ideas, modern methods and best practices in the field of human-centered image analysis, thus reflecting various aspects of the considered problem in a solid dedicated issue.

About the Journal

Message from the Editor-in-Chief

The imaging term, specific with journal, is to be considered in its broadest sense. Image processing, image understanding and computer vision are all terms related to imaging acquisition, its processing and the extraction of relevant information from the scene to obtain the underlying knowledge. All tasks related to the above items are oriented toward specific applications in a broad range of areas and topics. The *Journal of Imaging* is conceived as an efficient vehicle in the scientific community for the communication and transmission of the progress and research results in the topics covered.
