Message from the Guest Editors

The study of hurricane deposits in the aftermath of landfall (Ball et al. on Florida's Hurricane Donna in 1960) has been innovative in approach. Subsequent development of the mathematics behind megaclast hydrodynamics provides insight on the strength of pre-historic storms. Boulder deposits with or without organics (i.e., large coral heads) from the last few million years are newly open to quantification. Tidal forces, prevailing currents, and tsunamis must be taken into account, but regional geography aids in their potential elimination as contributing factors. The Holocene, Pleistocene, and Pliocene Warm Period are of particular interest. Storm deposits from these intervals provide a forecast for the near future under conditions of accelerated global warming at a rate previously unmatched. Contributions on coastal boulder deposits are solicited, but also on outwash deposits due to excessive rainfall. Survey papers on risk zones for hurricane landfall as well as literature reviews on the extent of published material from the Late Neogene are welcome.

Message from the Editor-in-Chief

Journal of Marine Science and Engineering (JMSE, ISSN: 2077-1312) focuses on research in the fields of Ocean Engineering, Coastal Engineering, Physical Oceanography, Geological Oceanography, Marine Biology, and Marine Environmental Science. It publishes reviews, regular research papers, and short communications, as well as Special Issues on particular subjects. Our aim is to encourage scientists to publish their experimental and theoretical results in as much detail as possible. There is no restriction on the maximum length of the papers.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed with Scopus, SCIE (Web of Science), Ei Compendex, GeoRef, Inspec, AGRIS, and other databases.

Journal Rank: JCR - Q2 (Engineering, Marine) / CiteScore - Q2 (Ocean Engineering)
