Chemotherapy and Invasive Fungal Infection

Message from the Guest Editor

Patients receiving chemotherapy are at risk of developing invasive fungal infection (IFI). The epidemiology is changing with the introduction of new targeted cancer immunotherapies. New diagnostic tests have been developed in recent years and are undergoing evaluation to determine their utility in clinical practice. Antifungal resistance is increasing, indicating the importance of routine antifungal susceptibility testing, therapeutic drug monitoring and the potential for combination antifungal therapy. New antifungal agents are currently being evaluated in trials. Given the recent developments in this area, the purpose of this Special Issue is to highlight these new developments through state-of-the-art reviews and original research articles. Sincerely,

Guest Editor
