Environmental Exposures and Their Impact on Reproduction

Message from the Guest Editor

Environmental exposures to various compounds and pollutants can profoundly impact human health. These exposures vary widely in type, dose, and duration. In particular, low-dose exposures to environmental compounds that act as endocrine disruptors—especially during the prenatal period—can have long-lasting effects that may become evident in adulthood. Such exposures are especially concerning because, although they occur at seemingly harmless levels, they can significantly disrupt developmental processes, with many of their long-term effects on physiological functions still poorly understood. This collection will focus on the consequences of prenatal exposure to endocrine-disrupting compounds, particularly their effects on reproductive function. The papers in this collection will explore how environmental exposures during early life affect reproductive outcomes, as well as the underlying biological mechanisms involved.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. François Gagné
Aquatic Contaminant Research Division, Environment and Climate
Change Canada, 105 McGill, Montreal, QC H2Y 2E7, Canada

Author Benefits

High Visibility:

indexed within Scopus, ESCI (Web of Science), PubMed, PMC, CAPIus / SciFinder, Embase, and other databases

Journal Rank:

JCR - Q1 (Toxicology) / CiteScore - Q2 (Pharmacology)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 27.6 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the first half of 2025).
