Message from the Guest Editors

Cancer is a complex disease that involves multifaceted mechanisms at transcriptional, translational, and biochemical levels. In addition, several molecules become important players in cancer progression and provide conducive environment for protein–protein interactions, metabolite cross-talk, and cell signaling. Studying such molecules may offer discovery of biomarkers, targetable clues for potentially repurposing drugs, as well as insights for developing predictive models of prognosis and improving cancer-free survival in patients. Systems biology has undoubtedly emerged as an integrative tool to achieve such advances. The *Journal of Personalized Medicine* is now opening a Special Issue that is fully devoted to ideas and research that build a strong foundation of Systems Biology in cancer research, with a call for papers involving basic, translational, and clinical research on this topic.
