

Special Issue

Chronic Disease Management in the Primary Care

Message from the Guest Editor

Chronic disease and its burden are threatening the sustainability of the healthcare system, so improving its management could be considered a strategic point.

Primary care provides the first contact, addressing a large majority of personal health care needs. It develops a partnership with patients and can be considered a complex system of relationship between individuals, community, and a variety of health professionals and structures of care. Furthermore, the role of chronic care management in primary care has grown up.

This Special Issue of the Journal of Personalized Medicine aims to highlight the current state of chronic disease management in primary care and showcase some of the latest findings in the field.

This issue will include studies that show evidence of chronic disease management in primary care having implications in policies or practices and reporting the use of innovative organizational models, technologies, performance measures (e.g., based on value) or patient/community engagement.
