## Immune-Mediated Diseases

### Message from the Guest Editors

Immune-mediated diseases constitute a broad spectrum of diseases that cause serious consequences in patients. These diseases result in a clear compromise of immune response, which can cause an abnormal functioning of organs and systems, with responses at a systemic level. In this sense, immune-mediated diseases are not known in all cellular and molecular mechanisms. In addition, the repercussions on patients themselves are severe at both social and psychoneuroendocrinological levels. In this Special Issue, we want to bring together research that will allow us to give our patients personalized and more effective medicine.

## About the Journal

### Message from the Editor-in-Chief

*Journal of Personalized Medicine* is one of the few journals that covers the diverse areas involved in the field, including research at basic, translational, and clinical levels. It focuses on “omics”-level studies that seek to define the basis of interindividual variation in susceptibility for a disease, its prognosis or definition of clinical subsets, and response to therapy (pharmacogenomics). We are also interested in systems biology as it relates to interindividual variation, and research on new methodologies, informatics, and biostatistics, in the aforementioned areas.

### Author Benefits

#### High Visibility:

indexed within Scopus, PubMed, PMC, Embase, and other databases.

#### Journal Rank:

CiteScore - Q1 (Medicine (miscellaneous))

#### Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 25 days after submission; acceptance to publication is undertaken in 5.8 days (median values for papers published in this journal in the second half of 2025).
