Orthopedic Diseases: Advances in Limb Reconstruction

Message from the Guest Editors

Advances in Limb Reconstruction' broadly includes orthopedic research into limb lengthening or distraction osteogenesis, limb deformity correction, the treatment of malunions and nonunions, osteomyelitis management, post-neoplastic limb salvage, osseointegration limb reconstruction, and custom or patient specific implants. New approaches, advances to traditional treatment, personalized medicine, or innovative solutions are welcome. Limb reconstruction often requires the creative utilization of the newest developments in orthopedic technology, so research to better understand these tools is prized.

About the Journal

Message from the Editor-in-Chief

Journal of Personalized Medicine is one of the few journals that covers the diverse areas involved in the field, including research at basic, translational, and clinical levels. It focuses on “omics”-level studies that seek to define the basis of interindividual variation in susceptibility for a disease, its prognosis or definition of clinical subsets, and response to therapy (pharmacogenomics). We are also interested in systems biology as it relates to interindividual variation, and research on new methodologies, informatics, and biostatistics, in the aforementioned areas.

Editor-in-Chief

Prof. Dr. Kenneth P.H. Pritzker

Department of Laboratory Medicine and Pathobiology, Department of Surgery, University of Toronto, 6 Queens Pk Crescent W.F, Toronto, ON M5S 3H2, Canada

Author Benefits

High Visibility:

indexed within Scopus, PubMed, PMC, Embase, and other databases.

Journal Rank:

CiteScore - Q1 (Medicine (miscellaneous))

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 25 days after submission; acceptance to publication is undertaken in 5.8 days (median values for papers published in this journal in the second half of 2025).
