Disorders that affect the external male genitalia are numerous and feature broad-spectrum entities, ranging from painless to disabling, and from benign to malignant. The extraordinary heterogeneity in terms of pathobiology, epidemiological trends, clinical presentation, and severity coupled with the diversity of available preventive and curative approaches, treatment effectiveness, potential complications, and adverse effects shape the complex and intriguing scientific and practical landscape in this constantly evolving area of urology.

This Special Issue will collate high-quality fundamental, clinical and translational research, as well as in-depth reviews, aiming to foster debate on new scientific insights, clinical trends, current challenges, and future perspectives compliant with this comprehensive topic.
