Special Issue

Spin Waves in Magnonic Crystals and Hybrid Ferromagnetic Structures

Message from the Guest Editor

In the last decade, the demand for alternatives to electric current in information technology (IT) has fueled interest in spin waves (SWs) as ultra-low-dissipation information carriers. Operating in the GHz range, SWs can be manipulated at the nanoscale in Magnonic Crystals, specially designed nanostructured periodic lattices. Their properties can be tailored through lattice design and external magnetic field tuning. Coupling SWs with ferroelectric layers in multiferroic systems offers enhanced tunability through voltage control. Vertical Magnonics involves stacks of ferromagnetic layers, and Hybrid Magnonics includes structures like artificial spin ice (ASI) layers and artificial quasi-crystals (AQCs), providing diverse stable configurations. This Special Issue gathers experimental investigations covering sample fabrication, characterization, and static or dynamic measurements. Additionally, it presents theoretical models and simulations to interpret experiments and predict effects arising from system complexity. Contributions discussing future applications in SW computing, interferometry, sensing, and logic devices are encouraged.

About the Journal

Message from the Editor-in-Chief

Magnetochemistry constitutes a multidisciplinary field where chemists and physicists not only study magnetic properties but also design and synthesize chemical compounds with desired magnetic properties. *Magnetochemistry* is inviting contributions in any field related with this area, such as theoretical models, crystal engineering, molecular magnetism, SMM, SIM, SCM, SCO, magnetic nanostructures, magnetic MOFs, magnetic recording, qubits, magneto-caloric materials, etc. Our goal is to share your contribution in a timely fashion and in a manner that will be valued by the scientific community.

Editor-in-Chief

Prof. Dr. Carlos J. Gómez García
Department of Inorganic Chemistry, Faculty of Chemistry, University of Valencia, C/Dr. Moliner 50, 46100 Burjasot, Spain

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Chemistry, Inorganic and Nuclear) / CiteScore - Q2 (Electronic, Optical and Magnetic Materials)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the first half of 2025).
