Properties of Mesoscopic-Scale Thick Ferromagnetic Thin Films

Message from the Guest Editor

Ferromagnetic thin films are currently used in the device systems of many application fields. Although their behavior can basically be ascribed to their specific electronic configurations, the role of morphology in the manifestation of their properties deserves much more attention once their structure and composition are controlled. That recommendation seems particularly crucial nowadays due to the use of nano-films and nanostructured samples. The film's morphology is induced by its growth process, which simultaneously impacts its inseparable bulk and surface parts. From a practical viewpoint, the bulk and surface parts correspond to the film's thickness and surface roughness (rms), respectively, which are differently impacted by a constant magnetic field effect due to their specific individual microstructures. All of the resulting film's magnetic properties are then a combined contribution of these two sample characteristics.

About the Journal

Message from the Editor-in-Chief

Magnetochimistry constitutes a multidisciplinary field where chemists and physicists not only study magnetic properties but also design and synthesize chemical compounds with desired magnetic properties.

Magnetochimistry is inviting contributions in any field related with this area, such as theoretical models, crystal engineering, molecular magnetism, SMM, SIM, SCM, SCO, magnetic nanostructures, magnetic MOFs, magnetic recording, qubits, magneto-caloric materials, etc. Our goal is to share your contribution in a timely fashion and in a manner that will be valued by the scientific community.

Editor-in-Chief

Prof. Dr. Carlos J. Gómez García

Department of Inorganic Chemistry, Faculty of Chemistry, University of Valencia, C/Dr. Moliner 50, 46100 Burjassot, Spain

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, CAPIus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Chemistry, Inorganic and Nuclear) / CiteScore - Q2 (Electronic, Optical and Magnetic Materials)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the first half of 2025).
