Large Data Sets for Diagnosis and Treatment of Neurologic Disorders

Message from the Guest Editor

There have been many studies on the effects of a few factors on the risk of dementia. These studies are important, but studies using larger numbers of variables on larger populations can provide clearer insight into issues of causation. There are existing databases from many sources, including the government, for profit and non-profit organizations, that can be used to extract this information. However, the statistical and computational challenges associated with such studies are significant, especially the construction of multivariate models. In addition, problems associated with case definitions are also significant. This Special Issue aims to collect research on the problems and promise of these big data approaches to dementia. This may include new ideas on: how to optimally identify target populations from these databases, optimal statistical approaches, regulatory and privacy issues in data access, and clinical applications.

About the Journal

Message from the Editor-in-Chief

You are invited to contribute a research article or a comprehensive review for consideration and publication in *Medicina* (ISSN: 1648-9144). *Medicina* is an open access, peer-reviewed scientific journal that publishes original articles, critical reviews, research notes, and short communications on medicine. The scientific community and the general public can access the content free of charge as soon as it is published.

Editor-in-Chief

Prof. Dr. Edgaras Stankevičius
Medical Academy, Lithuanian University of Health Sciences, Kaunas,
Lithuania

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, and other databases.

Journal Rank:

JCR - Q1 (Medicine, General and Internal) / CiteScore - Q1 (General Medicine)
