

Topical Collection

Antitumor Potential and Side Effects of Natural and Synthetic Compounds

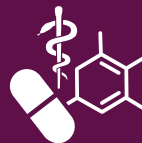

Message from the Collection Editor

Although many antitumor substances have been isolated from the natural kingdom, most authors have shown their cytotoxicity against malignant cells, but not against non-malignant cells. Recently, synthetic compounds of chromones and α,β -unsaturated ketones have shown very high antitumor potential, sometimes exceeding that of anticancer drugs. This Topical Collection calls for papers exploring the antitumor potential of natural and synthetic compounds against both malignant and non-malignant cells and their adverse effects. The papers that focus on the exploration of preparative or synthetic methods and the elucidation of action mechanisms are also within the scope of this issue.

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within PubMed, PMC, CAPlus / SciFinder, and other databases.

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 45 days after submission; acceptance to publication is undertaken in 5.7 days (median values for papers published in this journal in the first half of 2025).
