New Insights on the Role of Lipid Metabolism in the Development of Cardiac Dysfunction

Message from the Guest Editor

Myocardial lipid metabolism remains of critical importance in the resynthesis of ATP and maintenance of contraction in the healthy heart. However, lipid metabolism is suggested as a culprit mechanism in the development of cardiac dysfunction in a variety of chronic diseases such as pressure-overload hypertrophy, diabetes, obesity, and heart failure. Excessive fatty acid oxidation, decreased fatty acid oxidation, "lipotoxicity", and changes in other lipid metabolic pathways have been implicated as potential causes of cardiac dysfunction. However, the distinguishing metabolic aberrancy in lipid metabolism could be distinct to specific pathologies or populations. This Special Issue of *Metabolites* will be dedicated to publishing original articles and reviews that provide insight into the role of alterations in myocardial lipid metabolism that contribute to the development of cardiac dysfunction. We welcome the submission of original studies or review articles that highlight changes in lipid metabolism that are the cause or consequence of cardiac dysfunction in specific pathologies. In addition, studies and papers seeking to identify changes in lipid metabolism.

About the Journal

Message from the Editor-in-Chief

The metabolome is the result of the combined effects of genetic and environmental influences on metabolic processes. Metabolomic studies can provide a global view of metabolism and thereby improve our understanding of the underlying biology. Advances in metabolomic technologies have shown utility for elucidating mechanisms which underlie fundamental biological processes including disease pathology. *Metabolites* is proud to be part of the development of metabolomics and we look forward to working with many of you to publish high quality metabolomic studies.

Editor-in-Chief

Dr. Amedeo Lonardo

Internal Medicine, Ospedale Civile di Baggiovara, Azienda Ospedaliero-Universitaria, 41126 Modena, Italy

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Biochemistry and Molecular Biology) / CiteScore - Q2 (Endocrinology, Diabetes and Metabolism)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 14.4 days after submission; acceptance to publication is undertaken in 3.6 days (median values for papers published in this journal in the first half of 2025).
