Advances in Metal Rolling Processes

Message from the Guest Editor

Rolling is considered to be one of the most efficient formation processes. It plays an important role in the automated production of many metal foils or strips. The shape and properties of material are important criteria used in the rolling process to evaluate strip quality. Therefore, many factors, such as the metal flow characteristics, the shape detection and control, the work hardening, as well as the size effect, must be researched in detail. According to these mechanisms, there may be opportunities for some better rolling methods. For example, asynchronous rolling, electroplastic rolling, extrusion rolling, and warm rolling are often used to produce the foils of difficult-to-deform metals.

This Special Issue provides an excellent opportunity to publish theoretical and experimental studies on metal rolling, especially on alloy steel, magnesium alloys, amorphous alloys, high-entropy alloys, etc. Any new findings on this topic are welcome, such as metal flow rules in asynchronous warm/hot/cold rolling processes, microstructural evolution in special rolling processes, shape detection and shape control, etc.

About the Journal

Message from the Editor-in-Chief

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editor-in-Chief

Prof. Dr. Yong Zhang

State Key Laboratory for Advanced Metals and Materials, University of
Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083,
China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei Compendex, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /
CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 18.7 days after submission; acceptance to publication is undertaken in 2.7 days (median values for papers published in this journal in the second half of 2025).
