

Special Issue

New Developments in Friction Brake Materials (Volume II)

Message from the Guest Editor

In an automobile, the braking system is of primary importance for the control and safety of the vehicle, as well as the safety of the people within it. The brake assembly consists of a rotating element (the disc) and a couple of stationary friction elements (the pads). In braking, the friction elements are clamped against the disc, causing the vehicle to slow and stop. The brake pad composition contains different ingredients (binder, reinforcement, filler, friction modifier, and abrasive), while brake discs are typically made of grey cast iron. Different studies have recently been focused on improving the wear characteristics of both pad and disc materials, including disc surface modification through coating or other surface treatments. The improvement of brake materials is aimed not only at the enhancement of tribological properties (friction coefficient, specific wear, noise), but also at reducing the release of brake system debris.

The aim of this Special Issue is to improve the knowledge of brake materials (pads, disc) and their possible surface modifications, considering wear properties and emissions, which are very important from the environmental point of view.

About the Journal

Message from the Editorial Board

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editors-in-Chief

Prof. Dr. Hugo F. Lopez

Department of Materials Science and Engineering, College of Engineering & Applied Science, University of Wisconsin-Milwaukee, 3200 N. Cramer Street, Milwaukee, WI 53211, USA

Prof. Dr. Yong Zhang

Beijing Advanced Innovation Center of Materials Genome Engineering, State Key Laboratory for Advanced Metals and Materials, University of Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083, China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei Compendex, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /
CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 18 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2025).
