

Special Issue

Forming and Heat Treatment of Steel

Message from the Guest Editor

Although steel is cheap in price, it is not cheap in quality, and it is used widely due to its flexible performance in strength, formability, and function via structure control using plastic deformation or heat treatment.

Multimaterial construction is an attractive potential solution to the issue of weight reduction; however, steel is still considered the most appropriate and useful type of material. The development of ultrahigh-strength steel sheets is thus being accelerated and leading to a continuous improvement of their strength and formability. The tensile strength of ultrahigh-strength steel sheets for cold stamping has reached 1450 MPa. Hot stamping through combined press forming and heat treatment quenching not only improves strength but also reduces springback. Moreover, it is becoming standard practice to produce ultrahigh-strength components, with steel being used not only for structural but also for functional parts. In this Special Issue, research related to steel, such as forming, heat treatment, and thermomechanical processing, is invited.

About the Journal

Message from the Editor-in-Chief

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editor-in-Chief

Prof. Dr. Yong Zhang

Beijing Advanced Innovation Center of Materials Genome Engineering,
State Key Laboratory for Advanced Metals and Materials, University of
Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083,
China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei
Compendex, CAPus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /
CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 15.3 days after
submission; acceptance to publication is undertaken in 2.9
days (median values for papers published in this journal in
the first half of 2026).
