Hydrogen Embrittlement in Metallic Materials

Message from the Guest Editors

Hydrogen embrittlement (HE), which corresponds to the abrupt loss of a material's load-bearing capacity in presence of H, is often responsible for catastrophic and unpredictable failure of large-scale engineering structures. This embrittlement phenomenon occurs in many metallic materials. H embrittlement basically threatens any industries that aim to use high-strength alloys to make lightweight structural components, and with that, may set an abrupt halt to some of the pending infrastructures needed for a hydrogen economy. It is thus crucial to understand the mechanisms as well as to explore solutions for improving materials' resistance to H.

This Research Topic aims to cover all experimental and modeling studies associated with H embrittlement. The state-of-the-art research, development, and current challenges in the field of H embrittlement will be highlighted in this Research Topic, which is helpful to guide future research efforts.

About the Journal

Message from the Editorial Board

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editors-in-Chief

Prof. Dr. Hugo F. Lopez

Department of Materials Science and Engineering, College of Engineering & Applied Science, University of Wisconsin-Milwaukee, 3200 N. Cramer Street, Milwaukee, WI 53211, USA

Prof. Dr. Yong Zhang

Beijing Advanced Innovation Center of Materials Genome Engineering, State Key Laboratory for Advanced Metals and Materials, University of Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083, China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei Compendex, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /
CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 18 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2025).
