

Special Issue

Metal Plasticity and Fatigue at High Temperature

Message from the Guest Editors

The presence of high temperatures usually induces some material plasticity in the most stressed region of the system, which, combined with cyclic loading variation, may lead to low-cycle fatigue failure. In order to estimate the component fatigue life in such demanding operative conditions, a complete characterization of the high-temperature material behavior under cyclic loading should be performed. Moreover, a reliable structural durability approach, which includes experimental results in numerical and/or predictive models, needs to be developed as well. The choice of the most appropriate material model to be used in simulations, or even calibrating the model to experimental data, often represents the most critical step in the whole design approach. Experimental techniques and modeling have to be properly managed to guarantee the reliability of the estimated fatigue life. The purpose of this Special Issue is to collect papers aimed at providing state-of-the-art knowledge on the topic of metal plasticity and the fatigue strength of metals operating at high temperatures, with an emphasis on both experimental characterization and the numerical modeling of material behavior.

About the Journal

Message from the Editor-in-Chief

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editor-in-Chief

State Key Laboratory for Advanced Metals and Materials, University of
Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083,
China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei
Compendex, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /
CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 18.7 days after
submission; acceptance to publication is undertaken in 2.7
days (median values for papers published in this journal in
the second half of 2025).
