

Special Issue

Microstructure Evolution and Mechanical Properties of Magnesium Alloys

Message from the Guest Editors

Magnesium alloys have attractive properties such as high specific strength, high specific stiffness, and recyclability. Because of these characteristics, magnesium alloys are increasingly used in automotive, aviation, aerospace, electronics, and other consumer products. This also places a great demand on the mechanical properties of magnesium alloys. The mechanical properties of magnesium alloys are closely related to microstructure, including grain size, texture, precipitates, alloying elements, etc. In order to obtain the expected performance, a large number of scholars have devoted themselves to the development of new alloys and new processing technologies (including casting technology, plastic processing technology, powder metallurgy, 3D printing, etc.) to tailor the microstructure. The aim of this Special Issue is to provide an open platform to share the latest research results in the development of high-performance magnesium alloys. This Special Issue covers original research and review articles on recent advances in alloy design, microstructure modification, processing technology, deformation mechanism, and computer simulation.

About the Journal

Message from the Editor-in-Chief

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editor-in-Chief

Prof. Dr. Yong Zhang

Beijing Advanced Innovation Center of Materials Genome Engineering,
State Key Laboratory for Advanced Metals and Materials, University of
Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083,
China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei
Compendex, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) /
CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 18.7 days after
submission; acceptance to publication is undertaken in 2.7
days (median values for papers published in this journal in
the second half of 2025).
