Special Issue

Binder Assisted Metal Powder Shaping

Message from the Guest Editors

The use of binder material to facilitate shaping when metal powders are used is usual in most powder manufacturing techniques: powder injection molding, powder hot-embossing, binder jetting, and material extrusion (such as FFF and FDM), Usually, these techniques require different process steps; selection and characterization of materials, optimization and production of mixtures, shaping, debinding, and sintering. These process steps are related, and the variables of each one interact and influence the properties of the final parts. The success of the replication of final parts depends on the characteristics of the powder and binder. The binder has an essential role in the homogeneity of the mixture, shaping process, and the interaction with powders during debinding. Topics addressed in this Special Issue may include, but are not limited to the following: Powder and binder specified for PIM or Additive manufacturing using binder assisted method; Molding/shaping powder-binder; Debinding and Sintering; Post-processing; Numerical analysis of materials behavior to optimize processing conditions; Industrial applications.

About the Journal

Message from the Editor-in-Chief

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Editor-in-Chief

Prof. Dr. Yong Zhang

Beijing Advanced Innovation Center of Materials Genome Engineering, State Key Laboratory for Advanced Metals and Materials, University of Science and Technology Beijing, 30 Xueyuan Road, Beijing 100083, China

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei Compendex, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Metallurgy and Metallurgical Engineering) / CiteScore - Q1 (Metals and Alloys)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 18 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2025).
