Oral Microorganisms and Systemic Diseases

Message from the Guest Editors

The human being is a superorganism made up of both its own cells and microorganisms that live on or in the human body. Most of these microorganisms are commensals and perform very important functions for humans. However, in the event of systemic problems or immunosuppression on the part of the subject, these microorganisms can become pathogenic and cause systemic problems or contribute to the aggravation of systemic disease pictures. In fact, under particular conditions, the virulence factors of oral microorganisms can reach distant organs or affect host immune responses.
