Message from the Guest Editor

Dear colleagues,

Next-generation memory devices have recently become an active area of research, prompted by the physical limitations of charge trap-based non-volatile memory (NVM) devices. Among them, resistive switching memory (RRAM) devices have been considered as the most promising NVM device since the fourth fundamental passive circuit element was postulated in 1971, and can store two distinctive resistance states, namely a high-resistance state (HRS) and low-resistance state (LRS). Ever since, a variety of resistive switching devices have been demonstrated with the hope of finding the next-generation NVM devices offering the advantage of being highly scalable: $4F^2$ in a single layer, which could be further reduced to $4F^2/n$, where F is a half of the pitch in a crossbar arrangement and n is the number of stacks of physical layers of resistive switching devices. However, these devices incur several severe issues for commercialization that result in frequent read/write errors and unnecessary power consumption. To fix the issues that affect the performance of RRAM devices, researchers are proposing various approaches regarding new materials, designs, and properties.

Message from the Editor-in-Chief

You are invited to contribute research articles or comprehensive reviews for consideration and publication in *Micromachines* (ISSN 2072-666X). *Micromachines* is published in the open access format. Research articles, reviews and other contents are released on the internet immediately after acceptance. The scientific community and the general public have unlimited free access to the content as soon as it is published. As an open access journal, *Micromachines* is supported by the authors or their institutes by payment of article processing charges (APC) for accepted papers. We are pleased to welcome you as our authors.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Ei Compendex, dblp, and other databases.

Journal Rank: JCR - Q2 (Instruments and Instrumentation) / CiteScore - Q1 (Mechanical Engineering)
