

# Special Issue

## Experimental and Clinical Treatment of Leishmaniasis

### Message from the Guest Editors

Leishmaniasis is caused by infection with the protozoan parasite *Leishmania*, which is transmitted by female sandflies. It is estimated that 700,000 to 1 million new cases occur annually. New cost-effective treatments are required that can be implemented in areas of the world where people live on low incomes. This Special Issue is a curated collection that brings together the latest research on novel treatments used for to treat cutaneous, visceral or mucocutaneous leishmaniasis at an experimental or clinical level. The key themes and topics covered in this Special Issue include, but are not limited to, the following:

- Drug treatment;
- Immunotherapy;
- Non-drug-based treatment methods.

Research articles and comprehensive reviews are welcome.

## About the Journal

### Message from the Editor-in-Chief

"Microorganism" merges the idea of the very small with the idea of the evolving reproducing organism is a unifying principle for the discipline of microbiology. Our journal recognizes the broadly diverse yet connected nature of microorganisms and provides an advanced publishing forum for original articles from scientists involved in high-quality basic and applied research on any prokaryotic or eukaryotic microorganism, and for research on the ecology, genomics and evolution of microbial communities as well as that exploring cultured microorganisms in the laboratory.

### Author Benefits

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, PubAg, CAPlus / SciFinder, AGRIS, and other databases.

#### Journal Rank:

JCR - Q2 (Microbiology) / CiteScore - Q1 (Microbiology (medical))

#### Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 15.2 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the first half of 2025).
