Regulation and Workings of the Gastrointestinal Microbiota

Message from the Guest Editor

The human gastrointestinal tract is an evolutionary adaptation of the one-cell amoeba. Evolutionary accommodation for ingress and egress introduced a layer of vulnerability that required the development of compensatory defense mechanisms. By design, the initial human bacterial flora is acquired during birthing from the bacterial flora of the female vagina. To understand bacterial governance of the gastrointestinal microbiota, one must comprehend those that function to regulate the bacterial constituency of the female genital tract. The basic stability of its oxidation/reduction potential and the paucity of exogenous bacterial challenges facilitate the identification of underlying mechanisms of bacterial governance.

Why has the gastrointestinal microbiota been such an enigma to understand is the inability to control variables that influence the oxidation/reduction potential of the microbiological environment. Bacterial pathogenicity constitutes a de-stabilization force. Both entities have developed well-defined mechanisms to address microbial pathogenicity. Current research needs to focus on improving the understanding of these mechanisms.

About the Journal

Message from the Editor-in-Chief

"Microorganism" merges the idea of the very small with the idea of the evolving reproducing organism is a unifying principle for the discipline of microbiology. Our journal recognizes the broadly diverse yet connected nature of microorganisms and provides an advanced publishing forum for original articles from scientists involved in high-quality basic and applied research on any prokaryotic or eukaryotic microorganism, and for research on the ecology, genomics and evolution of microbial communities as well as that exploring cultured microorganisms in the laboratory.

Editor-in-Chief

Environmental Research, 04318 Leipzig, Germany

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, PubAg, CAPlus / SciFinder, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Microbiology) / CiteScore - Q1 (Microbiology (medical))

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 15.2 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the first half of 2025).
