Deadline for manuscript
submissions:

closed (1 October 2019)

Message from the Guest Editor

Dear Colleagues,

Imaging spectroscopy (also called hyperspectral imaging or “HIS”) is one of the most powerful non-destructive remote sensing tools to obtain accurate mineralogical information about inaccessible targets—information which is often not available by other techniques. Identification of minerals and other geologic materials using visible to near infrared (VNIR), shortwave infrared (SWIR), and now longwave infrared (LWIR) spectroscopy is well established. [...] The aim of this special issue is to focus on recent advances in the understanding and the quantitative interpretation of mineral/rock spectral signatures in the VNIR, SWIR and LWIR spectral ranges in terms of chemical composition and physical properties, the understanding of intimate/areal mixtures as well as radiative transfer modeling.

Message from the Editor-in-Chief

Minerals welcomes submissions that report basic and applied research in mineralogy. Research areas of traditional interest are mineral deposits, mining, mineral processing and environmental mineralogy. The journal footprint also includes novel uses of elemental and isotopic analyses of minerals for petrology, geochronology and thermochronology, thermobarometry, ore genesis and sedimentary provenance. Contributions are encouraged in emerging research areas such as applications of quantitative mineralogy to the oil and gas, manufacturing, forensic science, climate change, geohazard and health sectors.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), GeoRef, CaPlus / SciFinder, Inspec, Astrophysics Data System, AGRIS, and other databases.

Journal Rank: JCR - Q2 (*Geochemistry and Geophysics*) / CiteScore - Q2 (*Geology*)
