The "Green Earths" Glauconite and Celadonite: From Genesis to Application

Message from the Guest Editors

Authigenic "green earths" show a broad compositional spectrum, including potassic green clay with mica-like structures such as celadonite and glauconite and ferric illite, ferrous green clays and other phases. Celadonite and glauconite are comparable in physical, chemical and mineralogical characteristics. The micro-environment where these minerals form requires slightly oxygen-depleted conditions, facilitating the uptake of Fe into the structure so that glauconite is ubiquitous in marine deposits while celadonite forms in both marine and non-marine environments, more commonly by altering intermediate to mafic rocks. Recent studies show that there are subtle differences in their structure so different techniques can be applied to distinguish them. This is also important due to their application as pigments in creating artworks since antiquity. The aim of this Issue is to bring together researchers from different fields (sedimentology, mineralogy, petrology, and archaeometry) to acquire new knowledge on their geological history and successive transformation as well as a more precise classification of the green pigments in heterogeneous samples.

About the Journal

Message from the Editor-in-Chief

Minerals welcomes submissions that report basic and applied research in mineralogy. Research areas of traditional interest are mineral deposits, mining, mineral processing and environmental mineralogy. The journal footprint also includes novel uses of elemental and isotopic analyses of minerals for petrology, geochronology and thermochronology, thermobarometry, ore genesis and sedimentary provenance. Contributions are encouraged in emerging research areas such as applications of quantitative mineralogy to the oil and gas, manufacturing, forensic science, climate change, geohazard and health sectors.

Editor-in-Chief

Prof. Dr. Leonid Dubrovinsky

Bayerisches Geoinstitut, University Bayreuth, D-95440 Bayreuth,

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), GEOBASE, GeoRef, CaPlus / SciFinder, Inspec, Astrophysics Data System, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Mining and Mineral Processing) / CiteScore - Q1 (Geology)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 17.7 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the second half of 2025).
