

## Special Issue

# Advances in Fine Particles and Bubbles Flotation, 2nd Edition

### Message from the Guest Editors

The froth flotation process separates solid particles based on the differences in physical and surface chemistry properties. It is most efficient and cost effective for particles within a narrow size range, nominally from 10 to 100  $\mu\text{m}$  for the minerals. The flotation of fine particles ( $\sim 10 \mu\text{m}$ ) has become particularly important in recent years as advances have been made in grinding, which allow low grade mineral deposits to be economically exploited. The poor recovery of fines by flotation can be attributed to the low probability of bubble-particle collision, which decreases with the decrease of particle size, and high probability of detachment, respectively... The Special Issue of “Advances on Fine Particles and Bubbles Flotation” welcomes studies including: fine particle flotation, microbubble flotation, nanobubble flotation, particle-bubble interaction, collision and adhesion between particle and bubble, particle-bubble interface science, the aggregation of fine particle and bubble, and the dynamic study of fine particle and bubble flotation systems. We welcome contributions from all practitioners of this scientific topic.

## About the Journal

### Message from the Editor-in-Chief

*Minerals* welcomes submissions that report basic and applied research in mineralogy. Research areas of traditional interest are mineral deposits, mining, mineral processing and environmental mineralogy. The journal footprint also includes novel uses of elemental and isotopic analyses of minerals for petrology, geochronology and thermochronology, thermobarometry, ore genesis and sedimentary provenance. Contributions are encouraged in emerging research areas such as applications of quantitative mineralogy to the oil and gas, manufacturing, forensic science, climate change, geohazard and health sectors.

### Author Benefits

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), GEOBASE, GeoRef, CaPlus / SciFinder, Inspec, Astrophysics Data System, AGRIS, and other databases.

#### Journal Rank:

JCR - Q2 (Mining and Mineral Processing) / CiteScore - Q1 (Geology)

#### Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 17.7 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the second half of 2025).
