Biology Meets Mineralogy: Investigations into Biomolecule Interactions with Aluminosilicate Clay Minerals and Layered Double Hydroxides

Message from the Guest Editors

Interactions of biomolecules (e.g., nucleic acids, nucleotides, proteins, peptides, amino acids, polysaccharides, simple sugars, and organic acids) with aluminosilicate clay minerals (e.g., kaolinite, montmorillonite, illite, pyrophyllite, and allophane) and layered double hydroxides (LDHs) (e.g., green rust and hydrotalcite) collectively underlie key processes in soil biogeochemistry, industrial processing, geobiology, biotechnology, nanotechnology, and agriculture. These interactions are thus of great interest to researchers in several fields, including in the study of the origin of life. There exist many insights relating to these systems that are currently unrealized and will be the key to future progress in a wide range of disciplines. We welcome new advancements in the area of biomolecule interactions involving these prominent mineral surfaces. This includes, but is not be limited to, experimental and computational studies of protein adsorption onto clay minerals, mineral-catalyzed nucleic acid transformation, and enhancement of reactions that might have played a role in the origin of life.

About the Journal

Message from the Editor-in-Chief

Minerals welcomes submissions that report basic and applied research in mineralogy. Research areas of traditional interest are mineral deposits, mining, mineral processing and environmental mineralogy. The journal footprint also includes novel uses of elemental and isotopic analyses of minerals for petrology, geochronology and thermochronology, thermobarometry, ore genesis and sedimentary provenance. Contributions are encouraged in emerging research areas such as applications of quantitative mineralogy to the oil and gas, manufacturing, forensic science, climate change, geohazard and health sectors.

Editor-in-Chief

Prof. Dr. Leonid Dubrovinsky

Bayerisches Geoinstitut, University Bayreuth, D-95440 Bayreuth,
Germany

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), GeoRef, CaPlus / SciFinder, Inspec, Astrophysics Data System, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Mining and Mineral Processing) / CiteScore - Q1 (Geology)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 18.2 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2025).
