

## Special Issue

# Graphite Minerals and Graphene

### Message from the Guest Editors

Graphite generally occurs in three forms: microcrystalline, crystalline lump or vein, and crystalline flake. The microcrystalline graphite is formed through contact metamorphism of coal by large scale igneous intrusion. Flake graphite is assumed to form from ancient organic matters during long period of high-grade regional metamorphism. Vein graphite is assumed to be crystallized from thermal fluid. Graphite has some excellent great physical and chemical properties, such as lubricity, conductivity, anti-corrosion, high melting point in non-oxidizing condition etc.. Its consumption increases with the rapid development of electricity car and energy storage power station in recent years.

## About the Journal

### Message from the Editor-in-Chief

*Minerals* welcomes submissions that report basic and applied research in mineralogy. Research areas of traditional interest are mineral deposits, mining, mineral processing and environmental mineralogy. The journal footprint also includes novel uses of elemental and isotopic analyses of minerals for petrology, geochronology and thermochronology, thermobarometry, ore genesis and sedimentary provenance. Contributions are encouraged in emerging research areas such as applications of quantitative mineralogy to the oil and gas, manufacturing, forensic science, climate change, geohazard and health sectors.

### Author Benefits

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), GeoRef, CaPlus / SciFinder, Inspec, Astrophysics Data System, AGRIS, and other databases.

#### Journal Rank:

JCR - Q2 (Mining and Mineral Processing) / CiteScore - Q1 (Geology)

#### Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 18.2 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2025).
