Reactivity of Metal Complexes with Redox-Active Ligands

Message from the Guest Editor

Redox-active ligands are capable of being in several stable oxidation states, between which reversible redox changes are possible. The classical redox-active ligands include π -diimines, dithiolenes, and o-quinones. A unique property of these ligands lies in their ability to reversibly transform into radical anion or dianionic forms while maintaining a bond with a metal atom.

Acenaphthene-1,2-diimine (bian) ligands are of particular note, as they are capable of accepting up to four electrons due to the reduction of both diimine and naphthalene components. Transition metal complexes in combination with redox-active ligands are often used to stimulate redox-based catalytic reactions and to activate small molecules. For non-transition metals, unlike transition metals, a change in the oxidation state is not characteristic. However, the combination of non-transition metals and a redox-active ligand induces oxidative addition and reductive elimination reactions. This property makes such complexes similar to catalytically active compounds of transition metals and opens up the possibility of their use in catalysis.

About the Journal

Message from the Editor-in-Chief

As the premier open access journal dedicated to molecular chemistry, now in its 30th year of publication, the papers published in *Molecules* span from classical synthetic methodology to natural product isolation and characterization, as well as physicochemical studies and the applications of these molecules as pharmaceuticals, catalysts, and novel materials. Pushing the boundaries of the discipline, we invite papers on all major fields of molecular chemistry and multidisciplinary topics bridging chemistry with biology, physics, and materials science, as well as timely reviews and topical issues on cutting-edge fields in all of these areas.

Editor-in-Chief

Prof. Dr. Thomas J. Schmidt

Institute of Pharmaceutical Biology and Phytochemistry, University of Münster, Corrensstrasse 48, D-48149 Münster, Germany

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, Reaxys, CaPlus / SciFinder, MarinLit, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Biochemistry and Molecular Biology) / CiteScore - Q1 (Organic Chemistry)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 15.1 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the second half of 2025).
