Special Issue

Novel Catalysts for Asymmetric Synthesis

Message from the Guest Editors

The use of enantioselective catalytic procedures provides a wide range of possibilities for using achiral substrates for reactions. In the second half of the 20th century, metal complexes with chiral ligands were commonly used for asymmetric induction, with a constant search for the most effective systems. The tartaric acid esters and their derivatives used by Sharpless for epoxidation successfully competed with Jacobsen's salen complexes. Asymmetric hydrogenation in the presence of chiral rhodium catalysts are considered the greatest advantage among the various systems studied. An important breakthrough was the application of Noyori's Ru-BINAP complex for the asymmetric reduction of ketones and beta-ketoesters. Soon, procedures using metal complexes with chiral ligands of the chemical type for C-H activation appeared, supporting enantioselective transformations in low-reactive aliphatic systems. This concise and selective historical outline shows the continuous and still relevant search for both chiral ligands complexing metals and organocatalysts, providing the greatest stereodifferentiation capabilities for applications in asymmetric synthesis.

About the Journal

Message from the Editor-in-Chief

As the premier open access journal dedicated to molecular chemistry, now in its 29th year of publication, the papers published in *Molecules* span from classical synthetic methodology to natural product isolation and characterization, as well as physicochemical studies and the applications of these molecules as pharmaceuticals, catalysts, and novel materials. Pushing the boundaries of the discipline, we invite papers on all major fields of molecular chemistry and multidisciplinary topics bridging chemistry with biology, physics, and materials science, as well as timely reviews and topical issues on cutting-edge fields in all of these areas.

Editor-in-Chief

Prof. Dr. Thomas J. Schmidt
Institute of Pharmaceutical Biology and Phytochemistry, University of Münster, Corrensstrasse 48, D-48149 Münster, Germany

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, Reaxys, CaPlus / SciFinder, MarinLit, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Biochemistry and Molecular Biology) / CiteScore - Q1 (Organic Chemistry)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.1 days after submission; acceptance to publication is undertaken in 2.6 days (median values for papers published in this journal in the first half of 2025).
