

## Special Issue

# Graphene-Like Nanomaterials: Simulation, Preparation, Characterization and Applications

### Message from the Guest Editors

Graphene is a single carbon layer of graphite, which (according to the IUPAC terminology) can be described by analogy to a polycyclic aromatic hydrocarbon of quasi-infinite size. Graphene-like phases functionally originate from a perfect graphene sheet, and its complete oxidation with oxygen leads to the formation of graphene oxide, partial oxidation to the formation of rGO, and the introduction of structural defects (vacancies, the functionalization of the graphene surface with oxygen-containing carbon radicals, and similar). In each of these cases, a change in the hybridization of a part of the carbon atoms from  $sp^2$  to  $sp^3$  is observed. The size of the graphene-like particles varies depending on the synthesis methods used. Parallel to the increase in the content of oxygen in the graphene-like nanoparticles, their properties also change. The focus of the Special Issue will be as follows:

- Simulations of the modification/functionalization of different carbon phases to graphene-like nanoparticles;
- Synthesis of graphene-like phases;
- Various aspects of the application of graphene-like phases;

### Guest Editors

Dr. Teodor I. Milenov

Laboratory of Multifunctional Materials, Institute of Electronics of Bulgarian Academy of Sciences, Blvd. Tsarigradsko Chaussee 72, 1784 Sofia, Bulgaria

Prof. Dr. Hristiyan A. Aleksandrov

Faculty of Chemistry and Pharmacy, Department of Organic Chemistry and Pharmacognosy 1, University of Sofia "St. Kliment Ohridski", J. Bourchier Blvd., 1126 Sofia, Bulgaria

### Deadline for manuscript submissions

28 November 2025

## About the Journal

### Message from the Editor-in-Chief

Nanoscience and nanotechnology are exciting fields of research and development, with wide applications to electronic, optical, and magnetic devices, biology, medicine, energy, and defense. At the heart of these fields are the synthesis, characterization, modeling, and applications of new materials with lower nanometer-scale dimensions, which we call “nanomaterials”. These materials can exhibit unusual mesoscopic properties and include nanoparticles, coatings and thin films, metal–organic frameworks, membranes, nano-alloys, quantum dots, self-assemblies, 2D materials such as graphene, and nanotubes. Our journal, *Nanomaterials*, has the goal of publishing the highest quality papers on all aspects of nanomaterial science to an interdisciplinary scientific audience. All of our articles are published with rigorous refereeing and open access.

### Author Benefits

#### Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, CAPIus / SciFinder, Inspec, and other databases.

#### Journal Rank:

JCR - Q2 (Physics, Applied) / CiteScore - Q1 (General  
Chemical Engineering)
