Nutrition for Prevention and Control of Chronic Degenerative Diseases and COVID-19

Message from the Guest Editor

Dear Colleagues,

Chronic degenerative diseases (CDDs), represented by non-infectious diseases, of long duration and slow progression, including obesity, heart disease, diabetes, neurodegenerative diseases, chronic respiratory diseases, and cancer, have been up to now the most frequent causes of prolonged disability and death worldwide. In this particular moment, it is not possible to deny the relationship between CDDs and viral infection susceptibility. Following COVID-19, recent publications show that the most serious clinical conditions in COVID-19 have been observed in people with obesity and metabolic dysfunction as well as in protein-energetic malnourishment and micronutrient deficiencies. I invite authors to submit original research and review articles that address the progress and current understanding on the role of personalized healthy and sustainable diet in CDD and COVID-19.
