### **Message from the Guest Editor**

Dear Colleagues,

Nutrition during infancy establishes growth patterns and development that moderate short-term and long-term health and life expectancy. Human milk (HM) is indisputably the gold standard for feeding all neonates. Its unique macronutrient composition with optimal bioavailability and the myriad bioactives exerting health promotion and diseases such as necrotizing enterocolitis (NEC), bronchopulmonary dysplasia (BPD), retinopathy of prematurity (ROP), and bacterial sepsis can be avoided with appropriate feeding throughout life.

This Special Issue welcomes manuscripts of all original research, meta-analyses, or reviews on infant nutrition and infant feeding.
