Message from the Guest Editors

Natural compounds have always been a primary resource for humans to cure diseases and preserve good health. This Special Issue entitled "New Advances in Effect of Natural Compounds on Vascular Inflammation, Aging and Cardiovascular Disease", aims to provide deeper insight into the most recent advances in the characterization of natural compounds for the treatment and prevention of vascular inflammation, cardiovascular disease, and age-related conditions. Vascular inflammation underlies a variety of diseases and plays a central role in the development of cardiovascular disease, which is still the leading cause of death worldwide. Age-related mental and physical failures and diseases are a major burden at the individual and societal level and are often strictly related to vascular inflammation and endothelial dysfunction. Although many natural compounds that could be useful in these conditions have already been characterized, further investigations and validations are still needed, the drive remains to identify novel natural molecules with higher clinical safety and efficacy profiles. We welcome original research papers and reviews of the literature concerning this important topic.
