Coronaviruses: Virology and Zoonotic Potential

Message from the Guest Editor

Coronavirus infections of a wide variety of species can result in devastating consequences, exemplified by the recent pandemic caused by SARS-CoV-2 virus and its variants. Ongoing research has suggested a relatively large pool of coronaviruses that has the potential to jump from one species, e.g., bats, to another host, e.g., pigs and humans. Understanding the virology of coronaviruses in different species will aid our collective efforts in predicting and preventing zoonotic transmission. As such, this Special Issue of *Pathogens* intends to highlight cutting-edge research on the virology of coronaviruses of different species. Research on the zoonotic potential of coronaviruses is especially welcome.

About the Journal

Message from the Editor-in-Chief

The worldwide impact of infectious disease is incalculable. The consequences for human health in terms of morbidity and mortality are obvious and vast but, when infections of animals and plants are also taken into account, it is hard to imagine any other disease that has such a significant impact on our lives—on healthcare systems, on agriculture and on world economics.

Pathogens is proud to continue to serve the international community by publishing high quality studies that further our understanding of infection and have meaningful consequences for disease intervention.

Editor-in-Chief

Prof. Dr. Hinh Ly

Department of Veterinary & Biomedical Sciences, University of Minnesota, Twin Cities, MN, USA

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, Embase, PubAg, CaPlus / SciFinder, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Microbiology) / CiteScore - Q1 (Infectious Diseases)
