

Special Issue

Current Status of Acinetobacter Infections

Message from the Guest Editor

Acinetobacter baumannii has become a relevant threat for public health worldwide. This pathogen, belonging to the ESKAPE group, is one of the main causes of nosocomial infections with the highest mortality rates, such as pneumonia, blood infections, meningitis, UTIs, as well as skin and wound infections. Worryingly, *A. baumannii* infections are often difficult to treat because of the growing spread of multidrug-resistant strains globally. Even though few reports are described on *A. baumannii* infections in companion animals in veterinary medicine, the possible transmission from humans to animals or vice versa could represent a new issue for discussion. This Special Issue aims to collect papers on *Acinetobacter baumannii* infections in human and veterinary medicine, highlighting the importance of studies with a One Health approach to better define the real spread of this pathogen in hospital and extra-hospital reservoirs and environments. I look forward to your contributions.

About the Journal

Message from the Editor-in-Chief

The worldwide impact of infectious disease is incalculable. The consequences for human health in terms of morbidity and mortality are obvious and vast but, when infections of animals and plants are also taken into account, it is hard to imagine any other disease that has such a significant impact on our lives—on healthcare systems, on agriculture and on world economics.

Pathogens is proud to continue to serve the international community by publishing high quality studies that further our understanding of infection and have meaningful consequences for disease intervention.
