Blood-Culture Negative Endocarditis

Message from the Guest Editors

Blood culture negative endocarditis (BCNE) is a challenge for clinicians and microbiologists because its management is difficult and can be associated with a higher risk of valvular destruction and mortality than endocarditis with documented microorganisms. BCNE still remains in a variable percentage of patients depending on geographical and socioeconomic factors. The development of molecular assays and other techniques has improved the number of patients with documented agents causing endocarditis. In this Special Issue, we encourage researchers to share their experience in this interesting and changing topic. Increasing the knowledge of endocarditis due to fastidious microorganisms and emerging ones is necessary for improving the diagnoses and prognosis of this condition.

About the Journal

Message from the Editor-in-Chief

The worldwide impact of infectious disease is incalculable. The consequences for human health in terms of morbidity and mortality are obvious and vast but, when infections of animals and plants are also taken into account, it is hard to imagine any other disease that has such a significant impact on our lives—on healthcare systems, on agriculture and on world economics.

Pathogens is proud to continue to serve the international community by publishing high quality studies that further our understanding of infection and have meaningful consequences for disease intervention.

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, Embase, PubAg, CaPlus / SciFinder, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Microbiology) / CiteScore - Q1 (Infectious Diseases)
