# Photophysical Processes in Non-fullerene Organic Solar Cells

### Message from the Guest Editors

In the past few years, the development of non-fullerene acceptors represented by Y6 has greatly improved the power conversion efficiency of organic solar cells. At present, the power conversion efficiency of organic solar cells exceeds 19%, showing their broad commercial prospect. On the one hand, the improvement in the photoelectric conversion efficiency of non-fullerene solar cells benefits from the good photon absorption characteristics of non-fullerene materials in the near-infrared region; on the other hand, this is attributed to their unique photophysical properties, which differ from those of fullerene solar cells. For example, the exciton diffusion length of the newly emerging Y acceptors can exceed 50 nm, which is much longer than that of traditional acceptors and conducive to exciton dissociation in non-fullerene solar cells. However, the physical processes underlying these issues need to be further clarified. We aim to discuss various topics related to the photophysical mechanism in non-fullerene solar cells, including advances in device physics and photoelectric conversion dynamics. Both original research articles and reviews are welcome.

## About the Journal

### Message from the Editor-in-Chief

You are invited to contribute a research article or a comprehensive review for consideration and publication in *Photonics* (ISSN 2304-6732). *Photonics* is an online open access journal covering both the fundamental and applications of optics and photonics. *Photonics* strives to provide an avenue to allow authors to disseminate their scientific findings—both theoretical/ simulations and experimental works—in highly accessible peer-reviewed journal publications. The manuscript in *Photonics* will be handled with quick turnaround production processing time. We welcome authors to submit their manuscripts for publications in *Photonics*. Our goal in *Photonics* is to enable fast dissemination of high impact works to the scientific community.

### Author Benefits

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei Compendex, CAPlus / SciFinder, and other databases.

#### Journal Rank:

CiteScore - Q2 (Instrumentation)

#### Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 15 days after submission; acceptance to publication is undertaken in 1.9 days (median values for papers published in this journal in the second half of 2025).
