Anatomy and Physiology of Fruit Trees

Message from the Guest Editors

Fruit crops are vital sources of vegetal foods that ameliorate carbon over time and serve as models for the study of tree forest species. While the physiological status of trees is directly dependent on the structure, development, and plasticity of the vascular tissues, there is a gap in our knowledge regarding the anatomical variations present in fruit trees.

Understanding the anatomy of fruit trees and its association with their response to biotic and abiotic stresses is pivotal to developing more sustainable crops. This Special Issue of *Plants* will highlight the anatomy of fruit trees at different stages of development, from dormancy to fruit set, tissue levels, from roots to fruits, and their physiology in relation to environmental factors that alter crop productivity.

About the Journal

Message from the Editor-in-Chief

Plants is an open access journal which provides an advanced forum for research findings in areas related to plant function, its physiology, biology, taxonomy, stresses, and its interactions with other organisms. It publishes original research articles, reviews, reports, and conference proceedings (peer reviewed full articles) and communications. In original research papers, it is important that full experimental details are provided. We also encourage timely reviews and commentaries on topics of interest to the plant research community.

Editor-in-Chief

Prof. Dr. Dilantha Fernando
Department of Plant Science, University of Manitoba, Winnipeg, MB
R3T 2N2, Canada

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, PubAg, AGRIS, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q1 (Plant Sciences) / CiteScore - Q1 (Ecology, Evolution, Behavior and Systematics)
