

## Special Issue

# Molecular and Physiological Basis of Abiotic Stress Tolerance II

### Message from the Guest Editor

During the last six decades, research has shown that abiotic stresses can negatively impact plant growth and development and reduce crop production by up to 70%. Global climate changes have compounded the effect of these stresses on crop productivity. Some plants are more tolerant to 'stress' while others are susceptible. Understanding the complexity of both molecular and physiological factors that contribute to stress tolerance in crops is essential for maintaining productivity for food, fibre, and fuel. The Special Issue, "Molecular and Physiological Basis of Abiotic Stress Tolerance," will focus on the recent advancements in the role of ion channels, transporters, and signaling molecules and their contribution to tolerance to stresses such as salinity, drought, extreme heat and acid soils. We invite research articles and communications providing insights into different abiotic stresses.

## About the Journal

### Message from the Editor-in-Chief

*Plants* is an open access journal which provides an advanced forum for research findings in areas related to plant function, its physiology, biology, taxonomy, stresses, and its interactions with other organisms. It publishes original research articles, reviews, reports, and conference proceedings (peer reviewed full articles) and communications. In original research papers, it is important that full experimental details are provided. We also encourage timely reviews and commentaries on topics of interest to the plant research community.

### Author Benefits

#### Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, PubAg, AGRIS, CAPlus / SciFinder, and other databases.

#### Journal Rank:

JCR - Q1 (Plant Sciences) / CiteScore - Q1 (Ecology, Evolution, Behavior and Systematics)
