Message from the Guest Editor

It poses to all of us the challenge of rethinking sustainable pathways for our planet defining a new development model by transformative resilience. “Our common future” report (WCED 1987) sensed the need to introduce more efficient and sustainable production models in the use of energy and resources, reducing pollution and minimizing risks to health and accidents. Adopting a multidisciplinary and holistic approach on all dimensions of sustainability, community resilience can be increased through a structural combination of environmental sustainability, territorial safety and climate change contrasting policies. The purpose of this special issue is to emphasize the scientific results that can support the implementation of this new development model to guide the transition towards real sustainable development in all its dimensions (economic, social, environmental and institutional). I would like to encourage you to submit to this Special Issue your original research papers, short communication of preliminary results, review articles or commentaries to stimulate the discussion on this topic.
