Deadline for manuscript  
submissions:

**31 December 2019**

### Message from the Guest Editor

Dear Colleagues,

Remote sensing from the air and space has greatly advanced our understanding of the physical and biological elements of the Earth system, including stocks and fluxes of carbon and water, agricultural productivity, how vegetation responds to changes in the environment, atmospheric aerosol distributions and weather monitoring. This Special Issue will address recent advances in drone remote sensing. Submissions that describe new insights into unresolved problems that are enabled by observations at novel scales of space and time are particularly encouraged, as are submissions that demonstrate observations in novel environments. Manuscripts are welcome from all unmanned platforms, including commercial and government-funded systems. In the manuscript cover letter, authors should specifically articulate the opportunities or understanding enabled by unmanned observations that is not achievable using traditional (piloted) high-altitude airborne or satellite platforms.

Dr. James R. Kellner
