Message from the Guest Editor

Dear Colleagues,

Abnormal proliferation of cells in the body, leading to the development of either benign or malignant cancer, can happen in any type of cell. Thus, many types of cancers require unique differential diagnosis and custom treatment options. Despite momentous advances in biological and chemical sciences, early diagnosis and safe and complete eradication of cancer from the human body is still a major challenge. According to the World Health Organization [1], “Cancer is the second leading cause of death globally, and is responsible for an estimated 9.6 million deaths in 2018. Globally, about 1 in 6 deaths is due to cancer.”

In this Special Issue, we describe unusual clinical cases of cancer pathologies, challenging diagnosis and treatment. Utilization of new compounds (synthetic and isolated), showing promising anticancer activities and/or superior diagnosis, are also welcome.
