# Actuarial Mathematics and Risk Management

### Message from the Guest Editor

Among the most significant implementations of the principles of enterprise risk management (ERM), the risk management process (RMP) involves various quantitative phases, usually encompassed under the label quantitative risk management (QRM). Actuarial mathematic principles and tools can provide substantial support when implementing QRM phases, in particular when facing new risks or risks with changing features. Examples are provided by the assessment of product and portfolio risk profiles, the analysis of pooling effects and aggregate risk components, the use of stochastic processes in analyzing the evolution over time of individual risks and portfolio results, etc. This background suggests that there are many areas of modeling and managing risks that can benefit from novel research, aiming at both methodological and application innovation, in the insurance (life and non-life) context as well as in other economic sectors.

### Guest Editor

Prof. Dr. Annamaria Olivieri

Department of Economics and Management, University of Parma, Via J.F. Kennedy 6, 43125 Parma, Italy

### Deadline for manuscript submissions

closed (30 November 2022)

## About the Journal

### Message from the Editor-in-Chief

*Risks* is published in an open access format; research articles, reviews, and other content are released on the internet immediately after acceptance. Specifically, *Risks* welcomes submissions that (a) contribute with insight, outlook, understanding, and overview; (b) show creativity in terms of pedagogical methods and techniques; (c) help the transfer of theoretical and applied research into applications in the public and private domains; and (d) show responsibility for the impact on society. The scientific and the general public have unlimited free access to the content as soon as it is published.
