Development of Targeted Therapies for the Clinical Management of Cancer

Message from the Guest Editor

The development of targeted therapeutics has revolutionized the approach to targeting cancer in a way that minimizes the adverse side-effects associated with broad-spectrum applications. For example, small molecule enzyme inhibitors and monoclonal antibodies can be designed to target the specific biomolecules involved in tumorigenic cascades. In this Special Issue of *Sci*, we invite papers related to the design, development, testing, and regulatory approval pathways associated with targeted oncology therapeutics.
