Message from the Guest Editors

Dear Colleagues,

Smart cities have transformed how citizens relate to their environment and their city. Technology and the increasingly powerful connection offered by the Internet, as well as the generation and interpretation of data (big data), makes cities optimize their consumption, which translates into taking better care of the environment and reducing pollution. Sensorization has played a fundamental role in the collection of data, which, once analyzed in IoT and smart cities platforms, has allowed for the optimization of multiple decisions in terms of governance and the optimization of resource consumption.

This Special Issue is devoted to promoting the investigation of the latest research in IoT and smart cities and their effective applications, to explore the latest innovations in guidelines, theories, models, ideas, technologies, applications, and tools to assess the impact of the approach, and to facilitate technology transfer. The topics of interest for this Issue can be found on the website.
