Message from the Guest Editors

Dear Colleagues,

The ever-increasing demand for safe drinking water attributable to anthropogenic activities poses a serious threat to groundwater quality, also in relation to future water scarcity scenarios. Although several approaches have been developed to address the problem of urban aquifer pollution, the main challenges still remain.

Among the different approaches, GIS-based statistical, statistical analysis, numerical modeling and, more recently, stochastic modeling represent key tools for the assessment of quality deterioration of urban aquifers. The use and combination of these approaches can support water managers and public authorities in practical problems.

The aim of this Special Issue of *Sustainability* is to provide an overview of the different and innovative approaches used to assess urban aquifer pollution, in order to gain additional and useful insights on groundwater resource protection.

Message from the Editor-in-Chief

I encourage you to contribute a research or comprehensive review article for consideration for publication in *Sustainability*, an international Open Access journal which provides an advanced forum for research findings in areas related to sustainability and sustainable development. *Sustainability* publishes original research articles, review articles and communications. I am confident you will find the journal contributes to enhancing understanding of sustainability and fostering initiatives and applications of sustainability-based measures and activities.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE and SSCI (Web of Science), GEOBASE, GeoRef, Inspec, AGRIS, RePEc, CAPlus / SciFinder, and other databases.

Journal Rank: JCR - Q2 (*Environmental Studies*) / CiteScore - Q1 (Geography, Planning and Development)
