

## Special Issue

# Econometrics in Sustainable Financial Markets

### Message from the Guest Editor

Sustainable financial markets is predictability and a stable environment where financial decision-making results in sustainable operations. Investors should be well informed when making their decisions but they should also take into consideration other aspects, such as materially relevant environmental, social and governance factors, besides the purely financial one. The purpose of the Special Issue is to consider different methodological and empirical approaches to the problem of sustainable financial markets. A central issue is how sustainability can be defined and tested and what does it mean in the context of financial markets. What does it mean to be involved in socially responsible investing? What does it mean to improve transparency and information in financial markets including banking, mutual funds, and related areas? What is the role of monetary policy, interest rates and instability in financial markets, including the possibility of bubbles and / or Ponzi schemes?
